Coverage Trend
Positive trend shown on Codecov dashboard.

1. Purpose of this Document

This document provides updated Codecov evidence for the Campus Food Ordering Platform. It shows that automated testing is connected to the GitHub repository and that the main branch has measurable test coverage.

This updated version replaces the older Codecov screenshots and removes the test mock folder from the coverage evidence. The latest captured project coverage is **83.84%**, with **1718 of 2049** tracked lines covered.

2. Executive Summary

The updated Codecov report shows that the project remains above the 80% overall coverage target. The strongest tested areas are the API/backend logic, vendor workflows, admin analytics, and the shared authentication foundation. The student area remains acceptable but still has user-interface heavy paths that could be improved in future work.

3. Overall Coverage Breakdown

The table below summarises the updated Codecov folder-level results from the latest screenshots. The tests/mocks folder has been excluded from the coverage report so the figures focus on production and shared application source code.

Area	Tracked Lines	Covered	Missed	Coverage	Interpretation
adminControls	276	253	23	91.67%	Strong coverage for admin analytics and reporting features.
auth	195	161	34	82.56%	Good coverage for login and registration logic.
functions/api	138	127	11	92.03%	Very strong coverage for API, analytics, and payment logic.
shared-auth-foundation/src/js	47	47	0	100.00%	Fully covered shared auth helper and route guard logic.
student	898	668	230	74.39%	Acceptable coverage; more UI paths can be tested later.
vendor	495	462	33	93.33%	Very strong coverage for vendor workflows.
Subtotal	2049	1718	331	83.84%	Overall project coverage is above 80%.

Key update: Codecov no longer includes the test mock support files in the measured coverage folders. This makes the report cleaner and better aligned with production-code evidence.

Figure 1: Codecov main branch overview

This overview confirms that Codecov is connected to the repository and that the main branch is being measured. The latest captured coverage is 83.84%, with 1718 of 2049 tracked lines covered. The dashboard also shows the latest source commit as c119209 and a +100.00% trend.

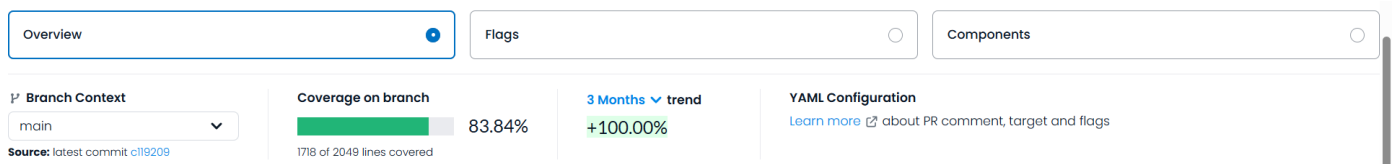

Figure 1: Codecov main branch overview.

Figure 2: Codecov coverage trend and repository coverage wheel

This screenshot gives visual evidence of the coverage trend over time. It also shows the repository-level coverage wheel, which provides a quick visual summary of covered and missed code areas.

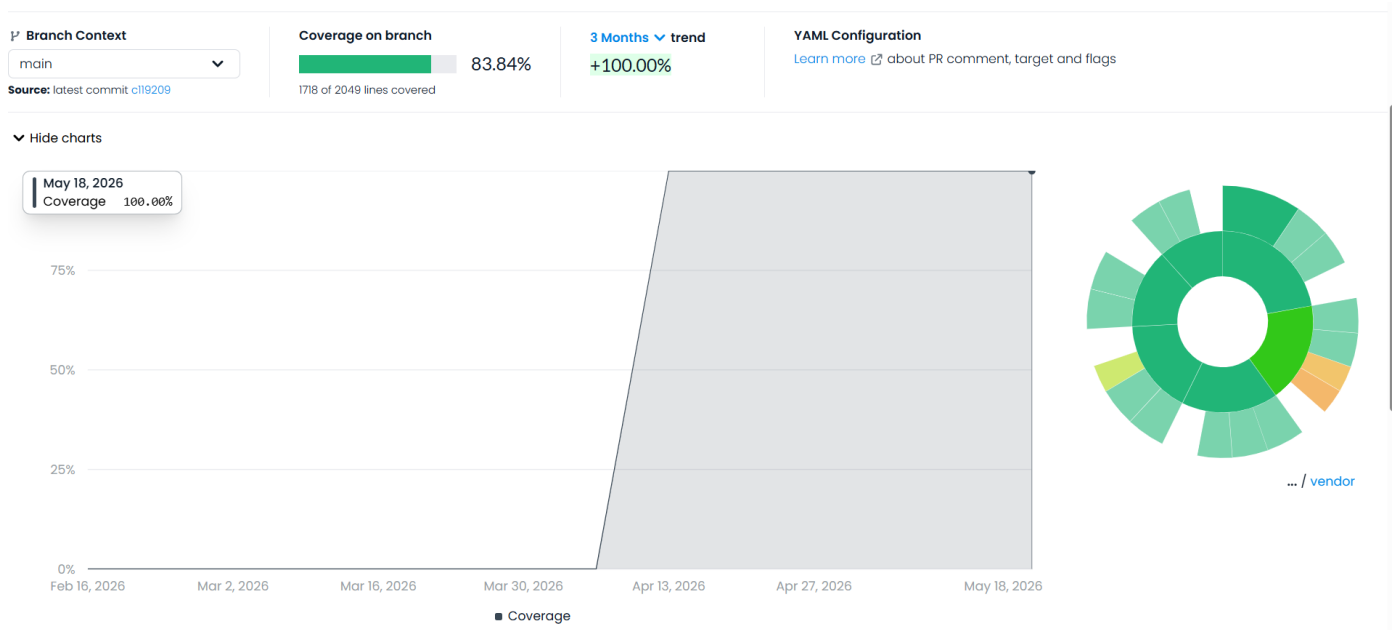

Figure 2: Codecov coverage trend and repository coverage wheel.

Figure 3: Folder-level coverage breakdown

This breakdown shows the main folders included in the updated coverage report. The report now includes adminControls and shared-auth-foundation/src/js, while tests/mocks has been removed from the Codecov evidence.

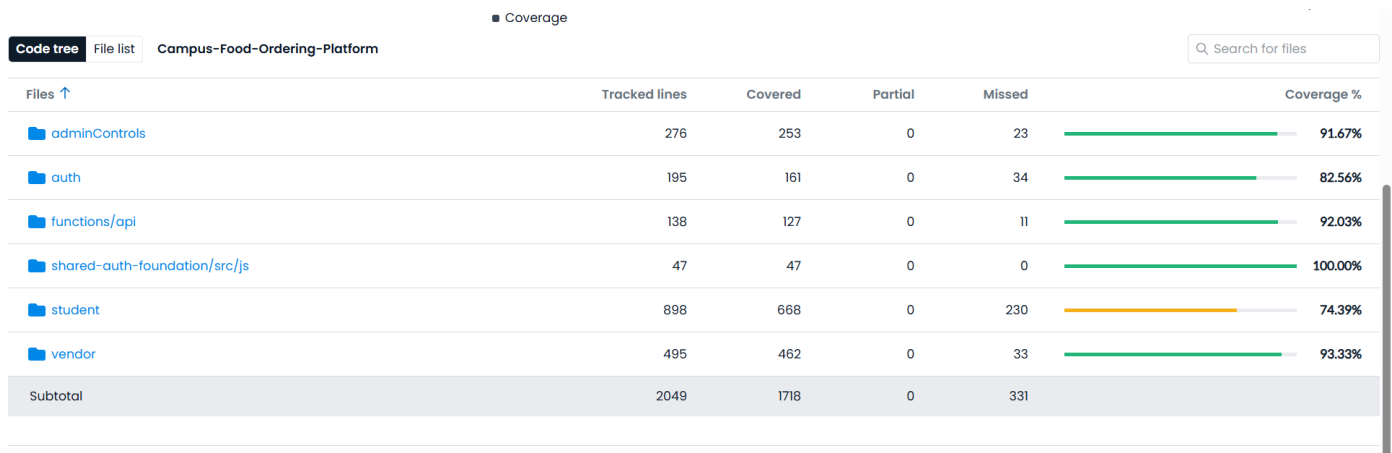

Figure 3: Folder-level coverage breakdown after excluding test mocks.

Figure 4: Admin controls coverage

The adminControls folder has strong coverage overall at 91.67%. analytics.js, custom-view.js, and peak-hours-report.js are all above 87%, showing strong testing of the admin analytics dashboard and reporting modules.

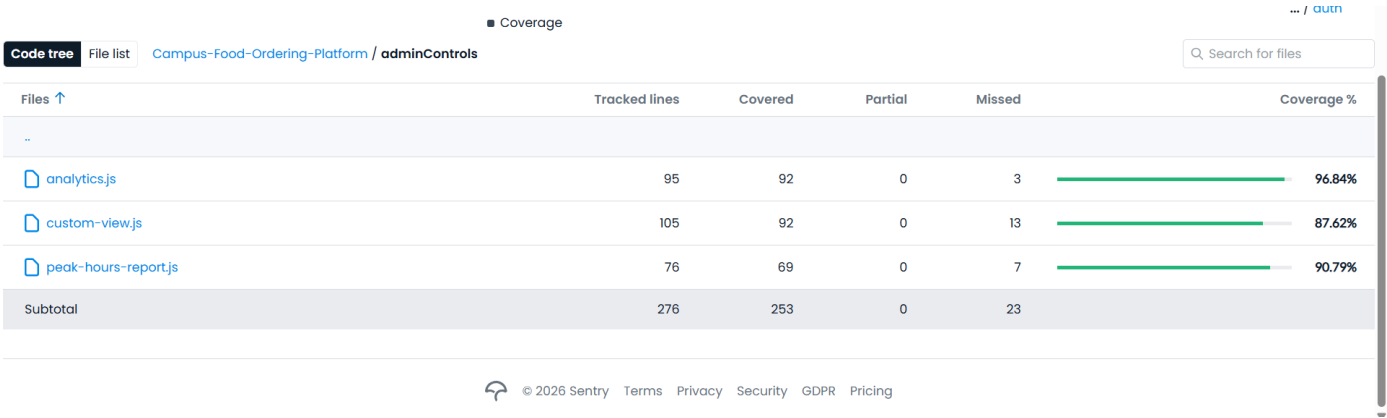

Figure 4: Admin controls coverage.

Figure 5: Authentication file coverage

The authentication files have strong coverage overall. login.js and register.js are both above 82%, showing that the login and registration logic was tested as part of the automated test suite.

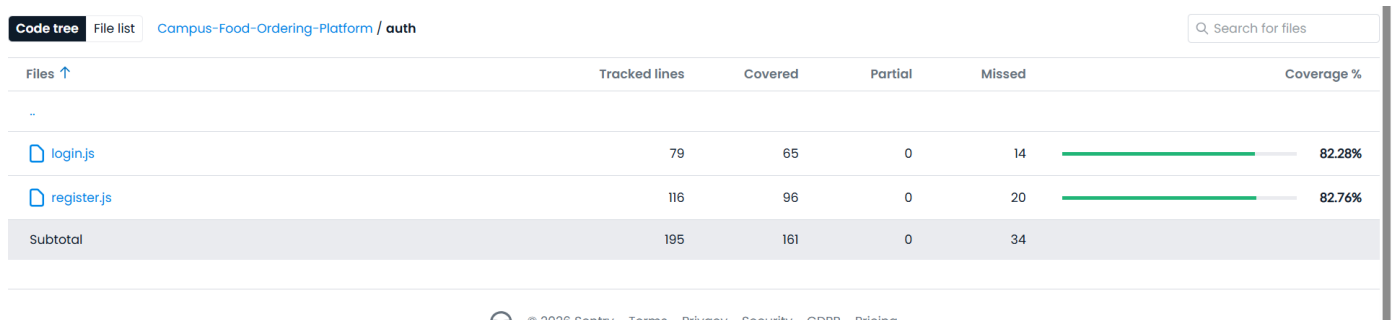

Figure 5: Authentication file coverage.

Figure 6: API and payment-related coverage

The API folder has very strong coverage. The PayFast folder is fully covered, while analytics.js and payment.js are both above 87%. This is important because payment and analytics logic are key backend features in the project.

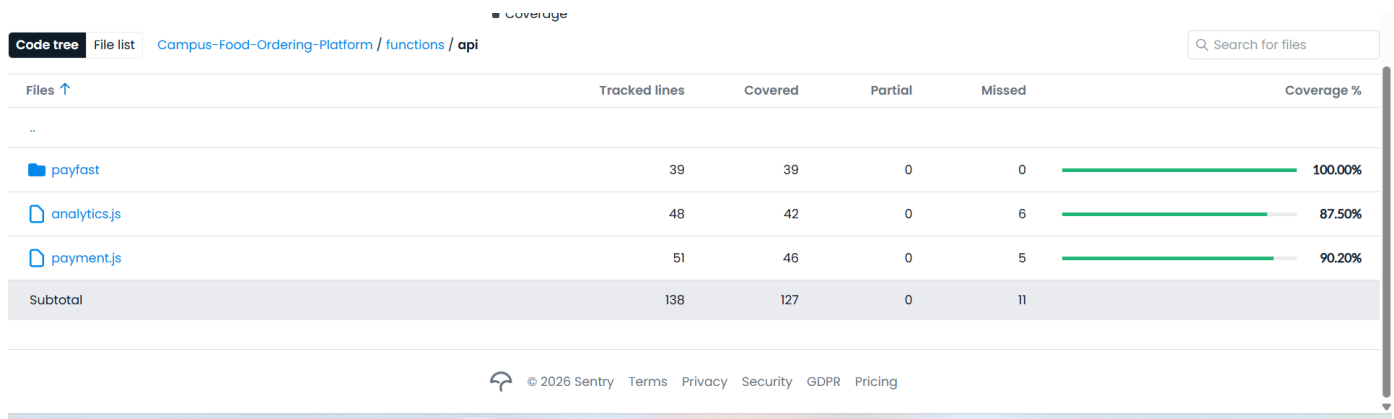

Figure 6: API and payment-related coverage.

Figure 7: Shared authentication foundation coverage

The shared-auth-foundation/src/js folder is fully covered at 100%. This includes authHelpers.js and routeGuards.js, which are important reusable authentication and route-protection utilities.

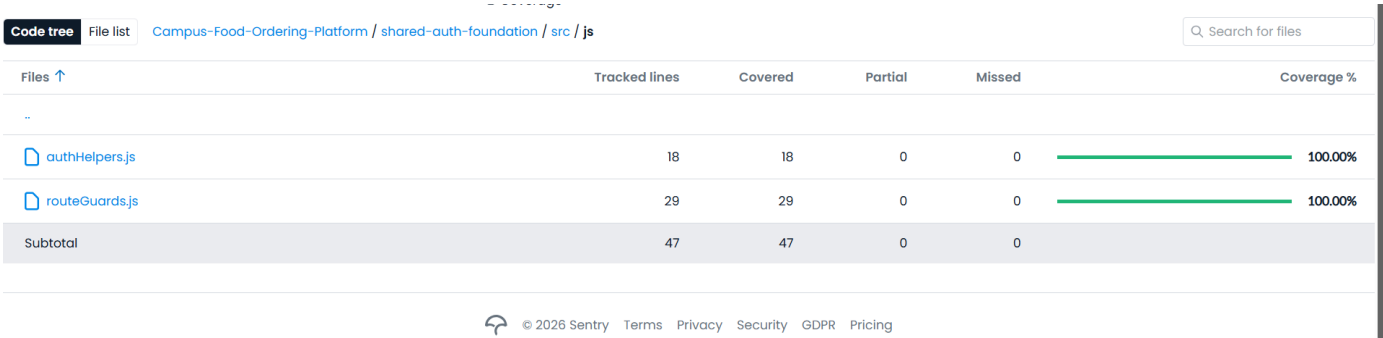

Figure 7: Shared authentication foundation coverage.

Figure 8: Student feature coverage

The student folder includes cart, dashboard, menu, and order-tracking logic. student-cart.js and student-dashboard.js are strongly covered, while my-orders.js and student-menu.js have lower coverage because they include more DOM rendering and user-interface paths.

Code tree

File list

Campus-Food-Ordering-Platform / student

Q Search for files

Files ↑	Tracked lines	Covered	Partial	Missed	Coverage %
..					
 my-orders.js	241	157	0	84	65.15%
 student-cart.js	264	227	0	37	85.98%
 student-dashboard.js	132	116	0	16	87.88%
 student-menu.js	261	168	0	93	64.37%
Subtotal	898	668	0	230	

Figure 8: Student feature coverage.

Figure 9: Vendor feature coverage

The vendor folder has strong coverage overall. menuCreation.js and orders.js are both above 96%, showing strong test coverage for core vendor workflows. vendor-dashboard.js has lower coverage and is noted as an area for future improvement.

Figure 9: Vendor feature coverage.

12. Detailed Coverage Interpretation

The tables below explain the most important coverage results from the updated Codecov screenshots. These values show which parts of the application were tested most strongly and which parts could be improved in future iterations.

Admin Controls Coverage

File / Area	Coverage	Covered Lines	Comment
analytics.js	96.84%	92 of 95	Main analytics dashboard logic is very strongly covered.
custom-view.js	87.62%	92 of 105	Custom analytics filtering and table rendering are strongly covered.
peak-hours-report.js	90.79%	69 of 76	Peak ordering hours calculations and rendering are strongly covered.

Authentication Coverage

File / Area	Coverage	Covered Lines	Comment
login.js	82.28%	65 of 79	Login logic is well covered.
register.js	82.76%	96 of 116	Registration logic is well covered.

API / Backend Coverage

File / Area	Coverage	Covered Lines	Comment
payfast folder	100.00%	39 of 39	PayFast callback/payment support logic is fully covered.
analytics.js	87.50%	42 of 48	Analytics endpoint logic is strongly covered.
payment.js	90.20%	46 of 51	Payment API logic is strongly covered.

Shared Authentication Foundation Coverage

File / Area	Coverage	Covered Lines	Comment
authHelpers.js	100.00%	18 of 18	Shared authentication helper functions are fully covered.
routeGuards.js	100.00%	29 of 29	Shared route protection logic is fully covered.

Student Feature Coverage

File / Area	Coverage	Covered Lines	Comment
my-orders.js	65.15%	157 of 241	Order display logic has partial coverage and can be improved.
student-cart.js	85.98%	227 of 264	Cart logic is strongly covered.
student-dashboard.js	87.88%	116 of 132	Dashboard logic is strongly covered.
student-menu.js	64.37%	168 of 261	Menu browsing and filtering has partial coverage and can be improved.

Vendor Feature Coverage

File / Area	Coverage	Covered Lines	Comment
menuCreation.js	96.25%	257 of 267	Menu creation and update logic is very strongly covered.
orders.js	97.04%	164 of 169	Vendor order workflow is very strongly covered.
vendor-dashboard.js	69.49%	41 of 59	Dashboard display logic has acceptable but improvable coverage.

13. Assessment Relevance

This evidence supports the testing and continuous integration requirements of the final submission. It shows that the project is not only implemented, but also connected to an automated coverage reporting workflow.

Requirement	Evidence in this document
Automated testing evidence	Codecov dashboard screenshots show measured test coverage on the main branch.
Coverage percentage	Overall coverage is 83.84%, which is above the 80% target.
Backend/API testing	functions/api has 92.03% coverage, including strong payment and analytics coverage.
Admin analytics testing	adminControls has 91.67% coverage, including analytics, custom view, and peak-hours report tests.
Shared authentication testing	shared-auth-foundation/src/js has 100.00% coverage for auth helpers and route guards.
Frontend testing	auth, student, vendor, and adminControls folders show measurable coverage across main user workflows.
Updated evidence	The screenshots in this document replace the older Codecov evidence screenshots and exclude test mocks from the reported coverage.

14. Conclusion

The updated Codecov screenshots show that automated testing and coverage reporting are active for the Campus Food Ordering Platform. The main branch currently has **83.84%** coverage, with particularly strong coverage in the API/backend, vendor, admin analytics, and shared authentication areas.

This provides clear evidence that the team used automated tests and measured coverage as part of the final software design submission. The removal of the tests/mocks folder from the Codecov evidence also makes the report more accurate because the coverage summary now focuses on application source code rather than test support files.
